

KLAMFLEX SOCKET STEEL FITTINGS

- ❑ Klamflex Socket Steel Fittings are available in all types of steel fittings such as Bends, Tees, Reducers, and Crosses, and are manufactured by welding half a Klamflex Coupling to the ends of a steel fitting.
- ❑ Bolts and nuts and not studs are used in the couplings, this ensures easy replacement of damaged fasteners. Klamflex also makes use of a profile plate and not lugs that are welded to the steel fitting to accommodate the tightening process.
- ❑ Installation is effected by simply inserting the plain ended pipe into the Klamflex Pipe Coupling and tightening the bolts.
- ❑ The use of these fittings will result in significant cost savings as only one piece of equipment is being purchased instead of separate fittings and couplings.
